

MSP Onboarding Guide

Vacation Suppression Workflow — Setup Instructions

1

Azure App Registration

Create the app registration

- Go to portal.azure.com → search for **App registrations** → **New registration**
- Name it `n8n Vacation Form` (or similar)
- Supported account types: **Single tenant** for your org only, or **Multitenant** if needed
- Redirect URI: set type to **Web** and enter your callback URL:
`https://[your-n8n-instance].app.n8n.cloud/webhook/auth/callback`
- Click **Register**

Collect your credentials

- Copy **Application (client) ID** from the overview page
- Copy **Directory (tenant) ID** from the overview page
- Go to **Certificates & secrets** → **New client secret** → copy the **Value** immediately

Note: Copy the **Value** column — not the Secret ID. The Value is a long string with letters, numbers and special characters. Copying the wrong one is the most common setup mistake.

Update the workflow nodes

- **Build MS Auth URL** node: update `tenantId` and `clientId`
- **HTTP Exchange Code** node: update `client_id`, `client_secret`, `tenant_id`, and `redirect_uri`
- Update the Redirect URI in **Azure Portal** → **Authentication** to match your n8n instance URL

2

Partner Variables node

Open the **Partner Variables** node in the workflow and update the following fields:

- `partnerId` — found in SaaS Alerts under **Settings** → **API** → **Show Partner ID**
- `partnerName` — your MSP name exactly as it appears in SaaS Alerts
- `api_key` — found in SaaS Alerts under **Settings** → **API** → **API Key**

3

Gmail SMTP credentials

Step A — Generate a Gmail app password

2-Step Verification must be enabled on your Google account first.

- Go to **myaccount.google.com** → **Security**
- Confirm **2-Step Verification** is enabled
- Search for **App passwords** in the search bar at the top of the page
- Give it a name (e.g. `n8n SaaS Alerts`) and click **Create**
- Copy the 16-character password immediately — you will not see it again

Step B — Configure in n8n

Open the Gmail SMTP node → credentials → enter the following:

- **User:** your full Gmail address
- **Password:** the 16-character app password (no spaces)
- **Host:** `smtp.gmail.com`
- **Port:** `465` (SSL) or `587` (TLS)
- **SSL/TLS:** enabled → Save and test

- Toggle the workflow to **Active** using the switch in the top-right of the n8n editor
- Copy the **Auth Entry** webhook production URL — this is the only URL your end users need
- Test end-to-end in an incognito window before sharing with users
- Share the Auth Entry URL — users authenticate with Microsoft, fill out the form, and suppressions are created automatically in SaaS Alerts

**You're ready to go live**

Users authenticate with Microsoft, complete the travel form, and suppressions are created automatically in SaaS Alerts.
